

Berlin Hotel Supply: Where Airbnb Hotels Should Recruit New Partners

I looked at 8,305 active Berlin listings from Inside Airbnb's public data (26 June 2026). This isn't Airbnb's internal data, so the numbers are a strong indication rather than the final word.

What I recommend

If Airbnb Hotels wants more hotel partners in Berlin, I'd start in **Pankow** and **Friedrichshain-Kreuzberg**. Between them, these two districts get almost 40% of guest demand in the city, yet they have only about a fifth of its hotel listings.

They need different approaches, though. Friedrichshain-Kreuzberg already has good hotels on Airbnb that list only a small part of their rooms, so the job there is to grow them. Pankow has hardly any hotel presence at all, so the job there is to bring new partners in.

What the data shows

Hotels are still a small slice of the Berlin market: 510 of 8,305 active listings, or 6.1%. Apartments make up nearly three-quarters.

The interesting part is where those hotels are, compared with where guests actually stay. I compared each district's share of booked nights with its share of hotel listings. In most districts the two are roughly in line. In three, they clearly aren't:

District	Share of demand	Share of hotel listings	Gap (points)
Pankow	16.8%	7.6%	+9.1
Friedrichshain-Kreuzberg	22.4%	14.3%	+8.0
Mitte	23.8%	33.1%	-9.3

Pankow and Friedrichshain-Kreuzberg get far more demand than their hotel supply would suggest, while Mitte has more hotels than its demand. Listings in the two opportunity districts are also the busiest in the city, at around 132 booked nights a year compared with 117 in Mitte.

Hotels can compete there. A hotel in either district costs about €67 per guest against €51–52 for an apartment, roughly 30% more; in Mitte the difference is 56%. Hotels are rated a little lower (4.66–4.69 vs 4.77), but Charlottenburg-Wilmersdorf shows the gap isn't fixed: hotels there are rated slightly higher than apartments (4.75 vs 4.73).

Up close, the two districts look very different. Friedrichshain-Kreuzberg's 73 hotel listings include well-known names like Leonardo Hotel Berlin Alexanderplatz and Amano East Side Hotel, each listing just one room type. Pankow's 39 come mostly from small hotels and individual hosts, and there isn't a single hotel chain among them.

Across Berlin, the market is fragmented. The 15 biggest operators account for only 144 of the 510 hotel listings (28%), and a few brands, such as Smartments Berlin and Little BIG Hotels, run several separate accounts.

What I'd do next

1. **Start with the hotels already on Airbnb in Friedrichshain-Kreuzberg.** Leonardo Hotel Berlin Alexanderplatz, Amano East Side Hotel, FLOTTWELL BERLIN Hotel and Gold Palais Hotel each list only one room type. Getting more of their rooms onto Airbnb is quicker and cheaper than finding new partners.
2. **Go after independent hotels in Pankow.** Most operators there run fewer than five listings, so what matters most is a simple onboarding process that works the same way every time.
3. **Help the lower-rated hotels catch up.** I'd begin with the larger operators below 4.5 stars: Hotel Ambiente (4.19), Apple City Hotel (4.25), Arco Smart Hotel Berlin (4.28) and Generator (4.48). Photos, descriptions and guest communication are the obvious places to start.
4. **Treat hotel groups as one partner.** Smartments Berlin and Little BIG Hotels each appear under more than one account. Managing each as a single partner would make things simpler on both sides.

How we'd know it's working

I'd check four numbers every quarter. First, hotel listings in Pankow and Friedrichshain-Kreuzberg, with the aim of bringing their hotel share closer to the Berlin average of 6.1%. Second, booked nights for those hotel listings. Third, the average hotel rating, to see whether the gap with apartments is closing. And fourth, how many hotel groups are being managed as a single partner.

What to keep in mind

- It's a single snapshot of public data from 26 June 2026, not Airbnb's own numbers.
- Booked nights are Inside Airbnb's estimates and partly based on reviews, so they show direction rather than exact demand.
- I left out listings with no published price (45% of the total), as well as prices below €10 or above €1,000.
- 510 hotel listings doesn't mean 510 hotels, because one hotel often lists several room types.
- Price per guest assumes every bed is used, which won't always be true. Some listings have no rating yet, and a few operators have no host name.
- I didn't compare prices in districts with fewer than five hotel listings.
